Abstracts

Magnetic polishing machines, also known as magnetic deburring or magnetic abrasive finishing machines, are industrial equipment that utilize magnetic fields to control abrasive media for precision surface finishing of metallic components. These machines operate by generating a rotating or oscillating magnetic field, which causes ferromagnetic abrasive particles to move against the workpiece, effectively removing burrs, sharp edges, oxidation, and micro-imperfections while improving surface roughness and achieving consistent results even on complex geometries. This non-contact, automated process is valued for its efficiency, minimal part handling, and ability to finish multiple components simultaneously, making it particularly suitable for industries requiring high-precision finishing such as automotive, aerospace, medical device manufacturing, and precision engineering.

The global Magnetic Polishing Machines market size was estimated at USD 52.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
