Report Overview

Magnetic Proximity Sensors are electronic devices designed to detect the presence or absence of a magnetic field without any physical contact. These sensors utilize a magnetic field to detect the presence of a target object, typically a ferrous metal, within a specified range. They consist of a sensing head, a cable, and an output signal. The sensing head contains a coil that generates an electromagnetic field, and when a magnetic object comes within the proximity range, it alters the field, which is then detected by the sensor. The output signal can be either analog or digital, depending on the specific model and application. Magnetic Proximity Sensors are widely used in various industries, including automotive, robotics, and manufacturing, for applications such as object detection, position sensing, and safety control. They offer advantages like high reliability, long life, and immunity to dirt and dust, making them suitable for harsh environments.
