## Abstracts

Magnetic rope testing is a non-destructive testing technology based on the principle of electromagnetic induction. It is mainly used to evaluate the internal and surface defects (such as broken wires, wear, corrosion, fatigue damage, etc.) of ferromagnetic ropes (such as steel wire ropes and cables). The core principle is to apply an external magnetic field to the rope to magnetize it. When there is a defect in the rope, the magnetic permeability at the defect changes, resulting in magnetic field leakage or magnetic field distribution distortion. The sensor then captures these magnetic signal changes to determine the location, type and severity of the defect.

The global Magnetic Rope Testing market size was estimated at USD 279.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
