Report Overview

Magnetic safety switches are devices that use a magnetic field to detect the presence of a guard or other movable safety device. When the guard is in place, the switch is closed and allows the machine to operate. When the guard is removed, the switch opens and stops the machine. This helps to prevent accidents and injuries.

Magnetic safety switches are typically used in industrial applications, such as on machines that have moving parts, such as conveyor belts, saws, and presses. They are also used in other applications, such as on doors and gates to prevent them from closing on people or objects.

Magnetic safety switches are typically made up of two parts: a sensor and an actuator. The sensor is mounted on the machine and the actuator is mounted on the guard or other movable safety device. When the guard is in place, the sensor and actuator are aligned and the switch is closed. When the guard is removed, the sensor and actuator are no longer aligned and the switch opens.
