Abstracts

Magnetically Controlled Capsule Colonoscopy is an innovative, non-invasive method for examining the colon and rectum using magnetic control technology to guide a capsule endoscope precisely. Patients simply swallow a small capsule equipped with a high-definition camera, eliminating the need for inserting a traditional endoscope. The technology leverages an external magnetic field to control the capsule's movement and speed, ensuring comprehensive visualization of the intestinal tract. During the procedure, no anesthesia is required, providing a more comfortable experience. High-resolution images are transmitted in real time to the doctor's monitor, aiding in the detection of conditions such as polyps, ulcers, and early-stage cancer. This technique is especially suitable for patients who are unwilling or unable to undergo traditional colonoscopy, offering an efficient, safe, and convenient alternative.

The global Magnetically Controlled Capsule Colonoscopy market size was estimated at USD 237.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.40% during the forecast period.
