The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Magnetically Controlled Micro-Nano Robots competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of magnetically controlled micro-nano robots will reach 6.5k units, with an average selling price of US\$8,000 per unit. Magnetically controlled micro-nano robots are microelectromechanical/software devices that are remotely actuated, positioned, and controlled at the micron- to nanometer-scale by external magnetic fields. They typically consist of a magnetically responsive structure (such as a polymer embedded with magnetic nanoparticles, a magnetically coated metal film, or a monolithic metal microstructure) and a functional payload (a drug reservoir, sensor element, microgripper, or catalytic surface). They utilize an externally generated uniform rotating field, magnetic gradient, or alternating field to generate controlled torque, propulsion, or deformation, thereby achieving actions such as propulsion, flipping, grasping, opening and closing, or pumping. Compared to other microactuation methods, magnetically controlled approaches offer advantages such as strong external field penetration, minimal damage to biological tissue, rapid response, and real-time reversible control. Consequently, they are being widely researched and rapidly advanced towards engineering applications in areas such as targeted drug delivery, minimally invasive thrombectomy/sampling, intravascular/microfluidic device delivery, and microassembly. The overall industrial chain of magnetically controlled micro-nano robots can be summarized as follows: the upstream mainly relies on magnetic materials (such as ferrite, cobalt-nickel alloy, rare earth permanent magnets), micro-nano processing technology (photolithography, 3D printing, electrodeposition) and precision control systems (magnetic field generators, sensing/imaging equipment). Relevant suppliers include Hitachi Metals, TDK,

VACUUMSCHMELZE, 3D Systems, etc.; the downstream is widely used in biomedicine (targeted drug delivery, minimally invasive surgery, thrombus removal), micro-assembly and testing, environmental monitoring and fine chemistry and other fields.

The global Magnetically Controlled Micro-Nano Robots market size was estimated at USD 51.87 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.30% during the forecast period.
