## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Magnetically Controlled Reactor (MCR) competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A Magnetically Controlled Reactor (MCR) is an advanced type of shunt reactor used for dynamic reactive power compensation in high-voltage power systems. It operates based on the principle of magnetic saturation, where the inductance is regulated by adjusting the DC bias current in the magnetic circuit. This allows smooth, stepless control of reactive power, enhancing voltage stability and reducing power losses in the grid. MCRs offer fast response, high reliability, and minimal harmonic generation, making them ideal for modern smart grids, especially in applications like FACTS (Flexible AC Transmission Systems) and renewable energy integration.

The global Magnetically Controlled Reactor (MCR) market size was estimated at USD 508.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
