## Abstracts

A magnetically-controlled shunt reactor (MCSR) represents electrotechnical equipment purposed for compensation of reactive power and stabilization of voltage level in high voltage electric networks rated for voltage classes 36 ? 750 kV. MCSR is shunt-type static device with smooth regulation by means of inductive reactance. Increasing adoption of advanced technologies is likely to reduce the demand for power distribution and transmission equipment over the forecast period, and increasing number of power distribution and transmission equipment modernization projects across the globe is expected to drive market growth. With urbanization, the need for electricity to stabilize systems and regulate voltages is increasing. Increase in the number of power transmission, modernization, and upgrades is driving the growth of the shunt reactor market. The increasing level of urbanization drives the growth of the three-phase market segment. According to the number of phases, the market is divided into single-phase and three-phase. Of these, three-phase power generation is expected to account for the largest share owing to increasing industrialization. Oil-immersed reactors dominate the market growth due to their compatibility with high-voltage systems, and based on type, the market is segmented into air-core and oil-immersed. The major share of the global market is expected to be occupied by oil-immersed shunt reactors due to their compatibility with high-voltage systems.

The global Magnetically Controlled Shunt Reactors market size was estimated at USD 2737.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
