Abstracts

The magnetizer is a device used to magnetize materials, typically employed in the magnetization process of metal workpieces, tools, or magnetic materials to enhance their magnetic properties and efficiency. By controlling the current and magnetic field strength, the magnetizer can precisely impart the desired magnetic characteristics to the material. The demagnetizer, on the other hand, is used to eliminate the magnetism of a material, especially when magnetic properties are no longer needed or when interference from magnetic fields must be avoided in certain applications. The demagnetizer reduces the residual magnetism of the material to near zero by applying a reverse magnetic field or gradually decreasing the magnetic field strength. Both devices are widely used in manufacturing, the electronics industry, and other fields requiring magnetic processing.

The global Magnetizer and Demagnetizer market size was estimated at USD 384.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
