## Abstracts

Magneto-optical crystals are specialized materials that exhibit changes in their optical properties under the influence of a magnetic field. These crystals are essential in various applications such as optical isolators, modulators, and sensors. They are crucial in telecommunications, data storage, and laser systems due to their ability to manipulate light polarization and rotation. The Faraday effect, which causes the rotation of the plane of polarization of light passing through these crystals in the presence of a magnetic field, is a fundamental property exploited in these technologies. Magneto-optical crystals like terbium gallium garnet (TGG) and yttrium iron garnet (YIG) are widely used due to their high Verdet constant and low optical losses.

The global Magneto-Optical Crystals market size was estimated at USD 429.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
