Abstracts

A magnetoelectric speed sensor, also known as a magnetic pickup sensor or variable reluctance sensor, is an electromagnetic device that generates an AC voltage signal in response to changes in magnetic flux caused by the movement of a ferromagnetic target, such as a gear tooth or encoder wheel, passing near its pole piece. This self-generating, passive sensor operates without an external power source, producing a sinusoidal waveform whose frequency is directly proportional to the rotational or linear speed of the target, making it highly reliable for speed detection, synchronization, and timing applications in environments where durability, simplicity, and resistance to contaminants are critical.

The global Magnetoelectric Speed Sensor market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
