Report Overview

A magnetoresistive position sensor is a sensor that measures the position of an object. It uses the magnetic properties of magnetic materials to measure position. The sensor typically consists of a magnetic material, such as cobalt, iron, or nickel-iron, and an electrical circuit containing the magnetic material. When an object approaches the sensor, its magnetic field changes the distribution of the magnetic field inside the sensor, which causes the resistance of the circuit to change. By measuring the change in resistance of the circuit, the position of the object can be determined. Magnetoresistive position sensors are commonly used to measure the position of mechanical motion, such as measuring the position of the steering wheel in an automobile steering system or measuring the rotor position of an electric motor. This sensor has the advantages of small size, low cost, fast response and long service life.

The global Magnetoresistive Position Sensor market size was estimated at USD 1275.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
