Report Overview:

Magnetotellurics (MT) is a passive electromagnetic technique which uses natural time variations of the Earth's magnetic and electric fields to measure the electrical resistivity of the sub-surface. Electrical resistivity of rocks and minerals is an important physical property to measure as part of attempts to understand geological structure and processes. It varies by many orders of magnitude, from very resistive crystalline igneous rocks, to very conductive saline-filled sedimentary rocks. As measured by the magnetotelluric method, the resistivity obtained is a bulk property of a volume of Earth material and is associated with factors such as rock composition, porosity and permeability as well as rock fluid composition and temperature.

The Global Magnetotelluric(MT) System Market Size was estimated at USD 277.55 million in 2023 and is projected to reach USD 339.21 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
