Abstracts

Magnetron sputtering targets are high-purity materials, typically in the form of discs, plates, or cylinders, that serve as the source material in magnetron sputtering? a physical vapor deposition (PVD) technique used to deposit thin films onto substrates. These targets are composed of metals, alloys, ceramics, or compounds and are mounted in a vacuum chamber where they are bombarded with energized ions, causing atoms to be ejected and deposited as a uniform coating. The performance and quality of the resulting thin film? critical in applications such as semiconductors, optical coatings, and decorative finishes? are directly influenced by the target's purity, density, microstructure, and geometric consistency.

The global Magnetron Sputtering Targets market size was estimated at USD 1274.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.42% during the forecast period.
