Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Main Engine Propeller Shaft Generator competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global market sales volume of main engine propeller shaft generators was approximately 940 units, with an average unit price of approximately US\$124,000 and an industry gross profit margin of approximately 20%?28%. Main engine propeller shaft generators are a type of marine propulsion-electric integrated system that relies on the rotational speed of the ship's main engine crankshaft/intermediate shaft and drives a synchronous generator through a gearbox, coupling, or variable speed constant frequency (VSG) power conversion system to output electricity. They are used to replace diesel auxiliary generators for power generation under navigation conditions, providing a stable energy source for the ship's loads (HVAC, lighting, living quarters), propulsion auxiliary systems (pumps, compressors, hydraulic stations), and navigation electronic equipment. Raw materials for the main shaft generator system include high-energy-product rare-earth permanent magnets (Nd-Fe-B), high-permeability silicon steel sheets, enameled copper wire and Class F insulation materials, marine-grade corrosion-resistant structural steel (A/B/AH36), large spherical roller bearings, and SiC or IGBT power semiconductor modules. Raw material costs account for approximately 60%?68% of the total system cost, typical rated power range is 900kW?5,500kW, power factor is 0.8?0.95, efficiency can reach 94%?97%, output can be 400/440/690V, frequency supports direct 50/60Hz or VSG constant frequency mode; to adapt to variable speed navigation, some systems are equipped with reluctance speed compensation and active grid-connected inverter modules to maintain stable power quality within the main engine speed range of 68?110%. Typical 13,000?18,000 TEU container ships use one main engine propeller

shaft generator system per ship, cruise ships usually have two parallel systems due to large loads, offshore platform supply vessels (PSV/OSV) are equipped with 1?3 systems under DP2/DP3 redundancy requirements, and LNG dual-fuel ships have a significantly higher configuration rate due to the need for cooling/reliquefaction loads.

The global Main Engine Propeller Shaft Generator market size was estimated at USD 116.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.10% during the forecast period.
