Abstracts

The main steam isolation valve (MSIV) is a precisely engineered automatic safety device designed to rapidly interrupt the flow of steam within the secondary loop of a nuclear power plant's main steam system; its unique rapid response mechanism and high reliability ensure that, in the event of a main steam pipe or feedwater pipe rupture, it effectively prevents excessive steam release, maintaining reactor cooling and containment pressure control, thereby safeguarding the operational safety and stability of the nuclear power plant; the valve's superiority lies in its ability to complete opening and closing actions in milliseconds, while also providing bidirectional flow interruption, significantly enhancing the nuclear power plant's efficiency and capability to respond to emergencies; its design thoroughly considers operational requirements under extreme conditions, making it an indispensable core component of the nuclear power plant's safety protection system, crucial for ensuring continuous operation and safe response during accidental situations.
