Abstracts

Malleable iron castings are a class of ferrous metal components produced by casting white iron and then subjecting it to an extended heat treatment process known as annealing, which converts the brittle as-cast structure into a more ductile and machinable form with favorable mechanical properties, including good strength, impact resistance, and wearability; this material is distinct from other cast irons like gray or ductile iron due to its unique combination of toughness and ability to withstand deformation, making it particularly suitable for applications where components must endure shock loading, vibration, or require intricate shapes that benefit from the casting process, such as in pipe fittings, automotive parts, agricultural machinery, hardware, and electrical accessories.

The global Malleable Iron Castings market size was estimated at USD 4500.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
