Report Overview

Mammalian cell expression system is a type of recombinant protein expression system that uses genetically modified mammalian cells to produce large amounts of specific proteins. Mammalian cells are a popular choice for protein expression because they have the ability to perform post-translational modifications such as glycosylation, phosphorylation, and disulfide bond formation, which are important for the biological activity and stability of many proteins. Mammalian cell expression systems are widely used in the production of recombinant proteins for research, therapeutic, and industrial applications. They offer high protein expression levels, produce proteins with correct post-translational modifications, and are suitable for the production of complex and difficult-to-express proteins.
