Abstracts

Mammalian protein expression refers to the biotechnology process of producing recombinant proteins using mammalian cell systems, which are engineered to synthesize specific proteins of interest. This method is particularly valued for its ability to perform complex post-translational modifications?such as glycosylation, phosphorylation, and proper folding?that are essential for the biological activity, stability, and functionality of therapeutic proteins, including monoclonal antibodies, hormones, cytokines, and vaccines. Unlike bacterial or yeast systems, mammalian expression systems, most commonly utilizing Chinese Hamster Ovary (CHO) cells or Human Embryonic Kidney (HEK) cells, better mimic native human protein structures, making them indispensable for producing biologics intended for clinical use. The process involves inserting a gene of interest into a mammalian host cell via transfection, followed by cell culture under controlled conditions to optimize protein yield, quality, and scalability. Applications are predominantly centered around pharmaceutical and biomedical research, particularly in drug development, where accurately modified proteins are critical for efficacy and safety.

The global Mammalian Protein Expression market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
