Report Overview

Chloride IonManganese Chloride (Manganese(II) Chloride, or Manganese Dichloride) is an excellent water soluble crystalline Manganese source for uses compatible with chlorides. Hydrate or anhydrous forms may be purchased. Forms include beads, flakes, powder, chunks, and others. Chloride compounds can conduct electricity when fused or dissolved in water. Chloride materials can be decomposed by electrolysis to chlorine gas and the metal. They are formed through various chlorination processes whereby at least one chlorine anion (Cl-) is covalently bonded to the relevant metal or cation. Ultra high purity and proprietary formulations can be prepared. The chloride ion controls fluid equilibrium and pH levels in metabolic systems. They can form either inorganic or organic compounds. Manganese Chloride is generally immediately available in most volumes. Ultra high purity and high purity compositions improve both optical quality and usefulness as scientific standards. Nanoscale elemental powders and suspensions, as alternative high surface area forms, may be considered.
