## Abstracts

Manned aircraft converted into drones refers to converting aircraft originally used for manned flights into drones capable of performing specific tasks in an unmanned state through a series of technical modifications and equipment installation. The modification mainly involves flight control system modification, sensor and data fusion system installation, communication system upgrade, hardware modification, software system development, etc., which requires the integration of multiple advanced technologies, such as high-precision sensor technology, reliable communication technology, and complex autopilot algorithms. The aviation field has extremely high requirements for safety. The modified drones must meet strict aviation safety standards and regulatory requirements in order to obtain certification from relevant aviation management agencies to ensure that they will not pose a threat to personnel and property during flight. Manned aircraft converted into drones can effectively reduce costs. Taking AVIC's TC9 unmanned helicopter as an example, the unmanned modification based on mature helicopter platform technology can reduce the application cost of helicopters from over 100 million to 10 million, while saving pilot training costs. Modification of some manned aircraft that are about to be retired or have been retired can extend their service life by 3 to 5 years and improve asset utilization. In some dangerous environments or tasks that are not suitable for direct human participation, such as military reconnaissance, nuclear radiation monitoring, disaster site investigation, etc., modified drones can replace manned aircraft to perform tasks and reduce personnel risks.

The global Manned Aircraft Modified Drone market size was estimated at USD 479.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.90% during the forecast period.
