Report Overview

A Manual Diaphragm Valve is a type of industrial control valve that is operated manually and is designed to regulate, control, or shut off the flow of various fluids, including gases, liquids, and slurries. It consists of a valve body, a diaphragm that separates the control mechanism from the process fluid, and a stem that connects the diaphragm to the manual actuator. The manual actuator can be a lever, gear, or handle that is turned or pushed to open or close the valve. The diaphragm is a flexible membrane that moves up or down to control the flow through the valve, ensuring a tight seal and preventing fluid leakage. Manual Diaphragm Valves are known for their durability, ease of maintenance, and ability to handle a wide range of fluids without contamination, making them suitable for applications in chemical processing, water treatment, food and beverage processing, and other industries where precise control and safety are paramount.
