## Abstracts

A manual external fixator is a medical device used in orthopedic surgery to stabilize and align broken bones or fractures from the outside of the body. It consists of metal rods or pins that are inserted into the bone through the skin and connected to an external frame. This frame holds the bones in the correct position, allowing them to heal properly while reducing the risk of further injury. The manual aspect of the fixator refers to the fact that adjustments can be made by the surgeon during the healing process to ensure optimal alignment and stabilization. This technique is commonly used for complex fractures, limb lengthening, or in situations where internal fixation (like plates or screws) is not suitable.

The global Manual External Fixator market size was estimated at USD 1714.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
