Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Manual and Power-Operated Chucks competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A chuck is a clamping device used to hold a workpiece or a cutting tool securely in place during machining operations such as turning, milling, or grinding. Manual Chucks are chucks that require the operator to adjust and tighten the jaws by hand, typically using a wrench or key. They are simple in construction, cost-effective, and commonly used where frequent or high-speed clamping is not required. Manual chucks provide flexibility for small batch production, prototyping, and general-purpose machining. Power-Operated Chucks are chucks that use hydraulic, pneumatic, or electric actuation to automatically open, close, and clamp the jaws. These are widely used in high-volume, precision, and CNC machining operations because they enable fast clamping, consistent gripping force, and improved efficiency. Power chucks are well-suited for applications demanding high accuracy, repeatability, and quick cycle times. In 2024, global Manual and Power-Operated Chucks production reached approximately 2.42 million units, with an average global market price of around US\$ 300 per unit. Global core manual and power-operated chucks players include SCHUNK GmbH & Co. KG, Kitagawa and SMW Autoblok etc. The top 5 companies hold a share about 31%. Asia Pacific is the largest market, with a share about 46%, followed by Europe and North America with the share about 27% and 20%.

The global Manual and Power-Operated Chucks market size was estimated at USD 729.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
