## Abstracts

A manual optical lens edger is a specialized piece of equipment used in optical laboratories and eyewear retail settings to precisely shape and bevel ophthalmic lenses according to the specific dimensions of an eyeglass frame. Unlike automated or digital edgers, these machines require operator intervention to control the grinding process, including adjustments for lens material, curvature, and desired edge finish. They are valued for their mechanical simplicity, durability, and lower initial cost, making them particularly suitable for small-scale operations, budget-conscious practices, or as backup units in larger facilities where customization or manual oversight is preferred over high-volume automation.

The global Manual Optical Lens Edger market size was estimated at USD 850.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
