Abstracts

A manual rotary microtome is a precision mechanical instrument used in histology, pathology, and biological research to produce thin, uniform sections of tissue samples embedded in paraffin or other media for microscopic examination. It operates via a handwheel that advances the specimen block toward a fixed blade, allowing controlled sectioning at thicknesses typically ranging from 1 to 100 micrometers. Unlike automated or semi-automated microtomes, manual versions rely entirely on user skill for operation, offering affordability, simplicity, and reliability in settings where high-throughput automation is unnecessary. They are essential tools in academic laboratories, small clinics, and resource-limited environments, valued for their durability, low maintenance, and ability to produce high-quality sections with proper technique.

The global Manual Rotary Microtomes market size was estimated at USD 125.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
