Report Overview

The swivel folding machine is a machine capable of bending the thin plate. Its structure mainly includes a bracket, a worktable and a clamping plate. The worktable is placed on the bracket. The worktable is composed of a base and a pressure plate. The base is composed of a seat shell, a coil and a cover plate. The coil is placed in a recess of the seat shell, and the top of the recess is covered with a cover plate. When in use, the coil is energized by a wire, and after being energized, a gravitational force is generated to the pressure plate, thereby realizing the clamping of the thin plate between the pressure plate and the base.
