Abstracts

Manufactured Garden Soil is topsoil enriched with compost and organic matter to make it better suited to actual plant growth. The addition of compost will reduce compaction and also provide nutrients that will feed the plants over many years. Garden soil is the bulk material used to fill garden beds. Compost, manure, and other organic materials are commonly used for leaf mold or leaf mulch. Loam is an important part of garden soil because it contains particles of different sizes, from fine particles (clay) to large coarse fragments (sand). Horticulture and crops grown in greenhouses are expected to increase the demand for artificial soil. In addition, limited or decreasing arable land is expected to drive the growth of the global artificial soil market in the near future.

The global Manufactured Garden Soil market size was estimated at USD 2364.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
