Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Marine Collagen Peptide competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Marine Collagen Peptide production reached approximately 1,246 tons, with an average global market price of around US\$ 44.5 per kg. Marine collagen peptides are functional protein ingredients produced mainly from by-products of the seafood industry—especially fish skins, scales, bones and heads, and in some cases other marine organisms such as jellyfish or squid. Native collagen is extracted from these materials after defatting and acid/alkali or enzymatic pretreatment and then enzymatically hydrolyzed to yield low-molecular-weight peptides typically in the 500–5,000 Da range, followed by filtration, concentration and spray-drying. Marine collagen is predominantly type I collagen, with good biocompatibility, solubility and cold-water dispersibility, and is often perceived as having high bioavailability and no risk of bovine spongiform encephalopathy or other ruminant-specific diseases, which supports its positioning as a “cleaner” animal protein source in some markets. In practice, marine collagen peptides are widely used in functional foods, dietary supplements, beauty-from-within products for skin, hair and nails, joint and bone health formulations, as well as in topical cosmetics and biomedical materials such as wound dressings and tissue-engineering scaffolds, and are increasingly linked with narratives around clean labels, valorization of fish-processing waste and sustainable use of marine resources. From the perspective of the industry chain structure, the upstream of marine collagen peptides mainly consists of fisheries and aquaculture and their processing enterprises. These enterprises centrally collect and pre-process by-products such as fish skin, scales, and bones, which were originally used for fishmeal, feed, or simply discarded. These raw materials mostly come from large fish processing and seafood

groups (such as export processing enterprises for salmon, cod, and tuna), supplemented by chemical and biological enzyme suppliers such as acids, alkalis, and enzyme preparations. The midstream consists of professional marine collagen/fish collagen and collagen peptide producers. Through processes such as defatting, dissolving, enzymatic hydrolysis, membrane filtration, desalination, and spray drying, they convert fish skin/scale collagen into marine collagen peptide powders or granules of different molecular weights and purities. Major global suppliers include Weishardt, Gelita, Lapi Gelatin, Pure Peptide Technology, and Reborn Biotech. They typically operate in the fields of pig, cattle, and marine collagen, with marine collagen often appearing in branded series. Downstream sectors consist of dietary supplement and beauty nutrition brands (such as Vital Proteins Marine Collagen, TruMarine?, etc.), functional beverages and ready-to-drink products, baking and dairy companies, sports nutrition and weight management brands, as well as biomedical material companies that use marine collagen to prepare dressings, medical membranes and tissue engineering scaffolds. The end market often uses selling points such as "fish source, clean label, easy absorption, beauty and anti-aging and joint health" to educate the market and create brand premiums. The annual production capacity of a single-line Marine Collagen Peptide is approximately 40 tons, with a gross profit margin of approximately 25%-35%. From a structural perspective, marine collagen peptides represent a relatively smaller yet more dynamic niche within the wider collagen and collagen-peptides market, and are generally viewed as growing faster than products derived from terrestrial animal sources such as bovine or porcine collagen. Demand is driven by demographic aging and long-term trends in beauty-from-within, joint and bone health, with marine collagen increasingly used in beauty drinks, stick packs, functional snacks and similar formats. At the same time, consumers motivated by religious considerations, dietary preferences (e.g., fish- or seafood-focused diets) or animal-welfare concerns often show a higher acceptance of marine proteins than of land-animal proteins, which helps position marine collagen as a "cleaner and lighter" option in premium and e-commerce channels. For upstream suppliers, marine collagen peptides both leverage seafood-processing by-products, aligning well with sustainability narratives and waste-reduction policies, and face constraints such as relatively low extraction yields, higher processing costs, and tighter regulation around fisheries and catches. These factors suggest that marine collagen is more likely to maintain a premium, differentiated positioning rather than competing purely on price against low-cost bovine collagen in commodity protein markets. Overall, marine collagen peptides are expected to deepen their penetration in beauty nutrition, functional beverages and high-end personal health products, while competition shifts away from simple capacity and price per ton toward peptide-profile design, clinically substantiated efficacy, robust sustainability and traceability schemes, and co-innovation with consumer brands.

where clearly differentiated players are more likely to secure a defensible position in this segment.
