Abstracts

Marine Current Energy Conversion (MCEC) is a renewable energy technology that harnesses the kinetic energy of ocean currents and tidal streams to generate electricity. Similar to underwater wind turbines, MCEC systems use submerged turbines installed in areas with strong, predictable marine currents. As water flows through the turbines, it rotates the blades, which drive a generator to produce power. Due to the high density of water, MCEC can generate more consistent and reliable energy compared to wind, making it a promising solution for coastal and island energy needs while contributing to decarbonization and energy diversification.

The global Marine Current Energy Conversion (MCEC) market size was estimated at USD 515.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.20% during the forecast period.
