Report Overview

Marine dissolved oxygen (DO) sensors are used to detect dissolved oxygen and oxygen saturation levels in a given body of water. Oxygen sensors detect dissolved oxygen, often abbreviated as DO. Although water is composed of hydrogen and oxygen, the sensor only measures 'free' oxygen, or oxygen that is not bound to another molecule. The sensor also measures oxygen saturation in the water. The dissolved oxygen sensor can analyze the corresponding water quality by detecting the level of dissolved oxygen in the surface water, which can help to better understand and analyze the biological ecological environment quality of surface water such as the ocean, and can greatly help the monitoring and governance of the environment.
