Abstracts

The marine engine propeller shaft is a key component that connects the ship's main engine to the ship's engine propeller. It is responsible for transmitting the engine's power to the propeller, thereby propelling the ship forward. The engine propeller shaft is usually made of high-strength metal materials (such as steel or alloy) to withstand the high loads and high-speed operation generated by the ship during navigation. It ensures smooth operation and reduces friction and wear through bearings and seals installed in the hull. The design of the marine engine propeller shaft varies according to the size of the ship, power requirements and type of propulsion system. Common ones include single-shaft and dual-shaft drive systems. It plays a vital role in the ship's propulsion system, ensuring the effective transmission of the ship's power and the stability of navigation.

The global Marine Engine Propeller Shaft market size was estimated at USD 473.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
