Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Marine Generator Bearings competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Marine generator bearings are key mechanical components used in ship generator sets to support the rotor shaft and ensure its stable rotation. They are mainly responsible for bearing axial and radial loads, reducing friction, and improving the efficiency and stability of generator operation. Due to the complex operating environment of ships at sea, bearings must have high corrosion resistance, impact resistance, high temperature resistance, and long life. Marine generator bearings usually use sliding bearings (such as sleeve bearings) or rolling bearings (such as ball bearings, roller bearings), and are combined with lubrication systems to maintain oil film stability and prevent metal contact. Its design must take into account the impact of hull movement (such as roll and pitch) on the shaft system to ensure that the generator can still operate reliably in a dynamic environment.

The global Marine Generator Bearings market size was estimated at USD 450.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
