Abstracts

Marine green methanol refers to methanol produced from sustainable sources, specifically intended for use as a fuel in the maritime shipping industry. This includes methanol produced from renewable electricity (e-methanol), biomass (biomethanol), or captured carbon dioxide combined with green hydrogen. Unlike conventional methanol derived from natural gas, marine green methanol offers a significantly reduced carbon footprint, helping the shipping sector meet increasingly stringent emissions regulations and contribute to decarbonization efforts. It can be used in existing methanol-capable engines or in dual-fuel engines. The industry trend for marine green methanol is experiencing rapid growth as the shipping sector faces increasing pressure to decarbonize. Several key factors are driving this trend. Firstly, the International Maritime Organization (IMO) has set ambitious targets for reducing greenhouse gas emissions from shipping, creating a strong regulatory push for alternative fuels like green methanol. Secondly, major shipping companies are actively investing in and piloting vessels capable of running on methanol, demonstrating a growing market demand. Thirdly, advancements in green methanol production technologies, including e-methanol and biomethanol pathways, are improving the feasibility and scalability of its production. Fourthly, the development of robust supply chains and bunkering infrastructure for methanol is crucial for its widespread adoption. This includes the establishment of methanol production facilities near major ports and the development of safe and efficient bunkering procedures. Furthermore, the availability of dual-fuel engines that can run on both conventional fuels and methanol provides flexibility for ship operators during the transition. The increasing collaboration between shipping companies, fuel producers, and technology providers is accelerating the development and deployment of marine green methanol solutions. The focus is also shifting towards lifecycle assessments of different fuel options to ensure that the overall environmental impact is minimized. Overall, the industry trend for marine green methanol is highly positive, with

increasing investments, regulatory support, and technological advancements paving the way for its wider adoption as a key fuel in the decarbonization of the maritime shipping industry.

The global Marine Green Methanol market size was estimated at USD 332.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.60% during the forecast period.
