Abstracts

A marine hydrogen fuel cell system is a system that converts the chemical energy of hydrogen into electrical energy through electrochemical reactions for use in ship propulsion, power supply, and other purposes. It primarily comprises components such as the hydrogen fuel cell stack, hydrogen supply system, oxygen (typically air) supply system, water and thermal management system, and power management system. The core component is the hydrogen fuel cell stack, where the anode and cathode inside, with the help of a catalyst, facilitate a reaction between hydrogen and oxygen to produce electricity and water. The electrical energy generated during this process can be used to drive the ship's electric motors or to power equipment on board.

The global Marine Hydrogen Fuel Cell Systems market size was estimated at USD 1895.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
