Abstracts

Marine inboard engines are internal combustion propulsion systems permanently installed within the hull of a watercraft, designed specifically for marine environments with features such as corrosion-resistant materials, water-cooled exhaust systems, and compatibility with marine transmissions and propeller shafts. These engines are categorized based on fuel type?primarily diesel and gasoline?with diesel variants dominating commercial and larger recreational vessels due to their durability, torque, and fuel efficiency, while gasoline engines are more common in smaller recreational boats for their lower initial cost and higher power-to-weight ratio. Key operational characteristics include their integration with the vessel?s structural and mechanical systems, reliance on raw water or closed-loop cooling, and compliance with stringent emissions and safety standards specific to maritime applications.

The global Marine Inboard Engines market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
