Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Marine Internal Combustion Engine Oil competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of Marine Internal Combustion Engine Oil was approximately 1.75 million tons, with an average selling price of about US\$1,100 per ton. Single-line capacity was approximately 100,000 tons per year, with an average gross profit margin of 10-20%. Marine Internal Combustion Engine Oil is a lubricant specifically designed to lubricate marine internal combustion engines. Its main functions are to reduce friction, protect metal components, improve engine efficiency, and extend engine life. These oils are used in marine diesel engines, gasoline engines, or other types of internal combustion engines to ensure their stable operation in harsh marine environments. The core raw materials in the upstream of the marine internal combustion engine oil industry chain mainly include base oils (mineral oils and synthetic oils) and compound additive packages (detergents, dispersants, antioxidants, and corrosion inhibitors). Its downstream applications are highly focused on the global shipping industry, providing lubrication for various low-speed and medium-speed diesel engines in ocean-going, coastal, and inland waterway vessels. Specifically, it is used in key equipment such as main engines, auxiliary generators, and turbochargers, and is a core consumable ensuring the safe, efficient, and long-life operation of marine power systems. Marine internal combustion engine oils, as a key component of the shipping industry, are closely linked to global maritime trade, fleet size, and environmental regulations. Currently, with the continued deepening of regulations such as the International Maritime Organization (IMO) sulfur caps and carbon emission reductions, the widespread application of low-sulfur fuel oils and the exploration of alternative energy technologies are driving the upgrading of engine oils towards high performance,

low alkalinity, and long service life to meet the differentiated lubrication needs of low-speed two-stroke and medium-speed four-stroke engines. Market competition is characterized by high brand concentration and strong technological barriers. Major international suppliers dominate with their formulation technology and global service networks, while regional manufacturers seek breakthroughs in niche markets by leveraging cost and channel flexibility. In the future, driven by the green transformation of the shipping industry, the replacement of aging fleets, and infrastructure needs in emerging economies, the marine engine oil market is expected to maintain steady growth and further evolve towards environmentally friendly, intelligent monitoring, and customized solutions.

The global Marine Internal Combustion Engine Oil market size was estimated at USD 1925.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.90% during the forecast period.
