Abstracts

A magnesium alloy sacrificial anode is a protective device used in cathodic protection systems. Made from magnesium alloys, which are highly electrochemically active, these anodes are designed to corrode preferentially, thus protecting other metal structures from corrosion. They are particularly effective in environments with high resistivity, such as freshwater or soil. Magnesium anodes are commonly used for protecting underground pipelines, storage tanks, and water heaters. Their strong driving potential makes them suitable for applications where a high level of protection is required, ensuring the longevity of critical infrastructure. The magnesium alloy sacrificial anode industry is linked to upstream magnesium mining and alloy production. Downstream, demand is driven by infrastructure maintenance, particularly in pipelines and storage facilities. Product specifications are focusing on improved alloy compositions for specific soil or water conditions, and optimized anode shapes for efficient protection. The future market is expected to grow, influenced by aging infrastructure and increasing investments in maintenance. The need for cathodic protection in renewable energy projects, such as geothermal plants, is also driving demand. Environmental concerns are pushing for more efficient and sustainable production and recycling processes.

The global Marine Magnesium Sacrificial Anode market size was estimated at USD 291.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
