Abstracts

Marine propulsion is a mechanism or system used to generate thrust to move a ship or boat across water. The setup of a propulsion system depends on the vessel size, transport system, and type of operation. Diesel marine propulsion system is a common type of marine propulsion system. The segment constitutes more than 46% share of the global marine propulsion market. Diesel marine propulsion systems are used in almost all types of vessels such as mall boats, ferries, defense vessels, and recreational vessels. In full electric marine propulsion systems, the engine is directly connected to the generator. Full electric marine propulsion enhances the overall efficiency of the vessel and also reduces the carbon footprint. Full electric marine propulsion system consists of a series of motors and generators. Electric power is transmitted from the engine to the propeller shaft through the motor controller and electric motor.

The global Marine Propulsion market size was estimated at USD 627.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
