Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Marine PVC Foam Core competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Marine PVC Foam Core is a lightweight, closed-cell polyvinyl chloride (PVC) structural core material designed for shipbuilding. It forms a uniform honeycomb or microporous structure through physical or chemical foaming process. It has low density (40-150 kg/m³), high specific strength, excellent water tightness, fatigue resistance and chemical corrosion resistance. Its core function is to replace traditional solid materials through sandwich composite technology (such as composite with fiberglass/carbon fiber panels), while maintaining structural strength. The weight of the hull is significantly reduced (40%-60% less than wood, 70%-90% less than steel), and the heat insulation, sound insulation and impact resistance are improved. It is widely used in key parts such as hulls, decks, bulkheads, etc. It is one of the core materials for lightweight and high-efficiency design of modern ships.

The global Marine PVC Foam Core market size was estimated at USD 92.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
