Abstracts

A marine radar transponder, also known as a Search and Rescue Transponder (SART), is an essential maritime safety device designed to enhance the detectability of vessels or survival craft in distress. When interrogated by an X-band radar signal (9 GHz), it transmits a series of response signals that appear as a distinct pattern of 12 equally spaced dots on the radar display of the searching vessel, allowing for precise location identification even in poor visibility conditions. These devices are typically used in lifeboats, life rafts, or on vessels to aid in search and rescue operations, and they are mandated under international conventions such as SOLAS (Safety of Life at Sea) for certain classes of ships. Their functionality relies on a combination of radar signal reception, amplification, and retransmission, ensuring they operate effectively across a range of environmental conditions, thereby significantly improving the chances of rescue in emergency situations at sea.

The global Marine Radar Transponder market size was estimated at USD 125.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
