Abstracts

The marine selective catalytic reduction (SCR) catalytic system is an exhaust gas after-treatment technology specifically engineered to reduce nitrogen oxide (NOx) emissions from marine diesel engines, primarily used in vessels to comply with stringent international environmental regulations such as the IMO Tier III standards. It operates by injecting a urea-based reductant, typically aqueous urea solution (AUS) or diesel exhaust fluid (DEF), into the exhaust stream, where it vaporizes and decomposes to form ammonia, which then reacts with NOx over a catalyst—commonly vanadium-based or zeolite—to convert harmful pollutants into harmless nitrogen and water vapor. Key components of the system include the SCR catalyst unit, dosing module, injection nozzles, control unit, and sensors, all designed to withstand harsh marine conditions including high humidity, salinity, and temperature variations. The technology is critical for ship operators seeking to meet emission control area (ECA) requirements while maintaining engine efficiency, and it is often integrated with other emission control systems such as exhaust gas recirculation (EGR) or scrubbers for comprehensive pollution abatement.

The global Marine Scr Catalytic System market size was estimated at USD 480.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
