### Report Overview

A marine thrust block is a special kind of thrust bearing used in large ship engines to resist the thrust generated by the propeller shaft and transfer the generated energy to the hull of ship. It is also known as a thrust box. Marine thrust blocks contain many wedge-shaped white metal pads that are fixed on a steel support and form a case. The main purpose of these blocks is to transfer the torque generated by the propeller to the hull of the ship through the metal housing. At the bottom of the housing, there is an oil reservoir that contains an oil-cooling coil, which circulates sea water. The pads available in the housing protect the fluid film of the oil reservoir from overheating and wear and tear, which may occur by the rotational movement of the drive shaft.

North America and Europe, followed by Asia-Pacific, are predicted to hold a relatively large market share and will dominate the marine thrust blocks market over the period of forecast.
