Abstracts

Marine Vibroseis is an advanced seismic survey technology used in underwater environments to explore and map sub-sea geological formations, typically for oil and gas exploration. Unlike traditional seismic methods that use explosive sources, Marine Vibroseis employs specialized equipment to generate controlled, low-frequency vibrations over an extended period. These vibrations penetrate the seabed and reflect off various geological layers, and the reflected signals are captured by hydrophones or geophones. The data collected helps create detailed images of the subsurface structures. This method is considered environmentally friendly and less disruptive to marine life compared to conventional seismic techniques, offering a more sustainable approach to marine geophysical surveys.

The global Marine Vibroseis market size was estimated at USD 466.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
