## Abstracts

A marine winch and a windlass are both mechanical devices used on ships for handling heavy loads, but they serve different purposes. A marine winch is designed for pulling, lifting, or mooring operations, commonly used for anchoring, towing, and cargo handling. It consists of a drum, motor, and braking system to control tension and movement. A windlass, on the other hand, is specifically used for raising and lowering the anchor and anchor chain. It features a gypsy wheel that grips the chain and often includes a warping drum for additional mooring functions. While both devices aid in ship operations, the key difference is that a windlass is dedicated to anchoring, whereas a marine winch has broader applications in ship handling and cargo operations.

The global Marine Winch and Windlass market size was estimated at USD 925.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
