Abstracts

Masked lithography systems, also known as optical projection lithography systems, are advanced semiconductor manufacturing tools that use a patterned mask (or reticle) to project intricate circuit designs onto silicon wafers coated with light-sensitive photoresist. These systems operate by transmitting ultraviolet light through the mask, which is then reduced and focused by a series of high-precision lenses or mirrors to transfer nanoscale patterns onto the wafer surface. As a critical component in the fabrication of integrated circuits (ICs), these systems enable the production of increasingly smaller and more complex semiconductor devices, with modern systems supporting features well below 10 nanometers. The technology is fundamental to the semiconductor industry, underpinning the manufacturing of everything from memory chips and processors to sensors and other microelectronic components.

The global Masked Lithography Systems market size was estimated at USD 10300.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
