Abstracts

Mass impregnated (MI) submarine cables are typically constructed with layers of insulating paper separated by polypropylene material, and impregnated with high-viscosity non-dripping insulating oil to enhance their insulation and thermal resistance properties. These cables exhibit a high breakdown field strength under direct current (DC) fields and can withstand significant field strength distortion. Their design eliminates the need for complex oil supply systems, making them suitable for high-drop environments, while the non-flow nature of the impregnating agent ensures stability and reliability in long-distance, high-depth interconnection projects.

The global Mass Impregnated (MI) Submarine Cables market size was estimated at USD 480.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 15.80% during the forecast period.
