Report Overview

The Material Sealing Tester is an instrument used to test the sealing performance of materials. It is usually used to test the sealing performance of packaging materials, such as food packaging bags, drug packaging bags, etc. The material sealing instrument can simulate a real packaging environment and test the sealing performance of packaging materials under different pressure, temperature, and humidity conditions. The test results can help manufacturers and users of packaging materials understand their sealing performance, thereby selecting suitable packaging materials and ensuring the quality and safety of packaging. The working principle of the material sealing instrument is to heat the tested packaging material to a certain temperature, then press it with another material to form a sealed bag. Then, within a certain period of time, evaluate the sealing performance of the packaging material by detecting pressure changes inside the bag or detecting gas permeation outside the bag. The material sealing instrument can usually perform multiple tests and automatically generate test reports based on the test results, making it convenient for users to analyze and compare.
