## Abstracts

A material testing furnace is a device used for heat treatment and performance testing of material samples. It provides a controlled temperature environment and enables the performance of materials to be evaluated and tested at different temperatures. Material testing furnaces usually have precise temperature control systems that can control parameters such as the temperature rise and fall rate and the time to maintain a constant temperature to meet the testing needs of different materials. These test furnaces can be used to study physical properties such as thermal stability, thermal expansion coefficient, and thermal conductivity of materials, and can also be used to evaluate engineering properties such as heat resistance, corrosion resistance, and mechanical properties of materials. Material testing furnaces are widely used in materials science, materials engineering, chemical engineering, electronic engineering, aerospace and other fields.
