## Abstracts

Materials Development Software is a collection of computer tools specifically designed to accelerate the discovery, design, and optimization of new materials. By integrating computational science, data management, and artificial intelligence technologies, it aims to transform the traditional materials research model, which relies on experience and trial and error. This type of software primarily encompasses three core approaches: computational simulations based on physical models, such as first-principles calculations and molecular dynamics, which can predict the structure and properties of materials at the atomic and microscopic scales; integrated materials engineering platforms, which combine multi-scale simulation tools with experimental data and process parameters to construct digital models for the entire process, from component design to manufacturing; and data-driven intelligent design systems, which leverage machine learning and big data analysis to uncover hidden patterns between material composition, process, structure, and properties from massive amounts of data, enabling rapid recommendations for new material formulations and synthesis schemes.

The global Materials Development Software market size was estimated at USD 107.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
